

## Advanced Assessment Techniques in Critical Care

Arthur Jones, EdD, RRT

<http://www.geocities.com/jonesapjr/index.html>

### Objectives:

- ▲ Explain the implications for pulmonary mechanics in ventilated patients.
- ▲ Describe procedures for determining optimal PEEP.
- ▲ Interpret common ventilator wave form abnormalities.
- ▲ Explain the significance of of end-tidal CO<sub>2</sub> measurements and wave forms.

## Pulmonary Mechanics

### Purposes For Monitoring Mechanics

- ▲ Determine appropriate ventilator settings
  - ◆ tidal volume
  - ◆ PEEP
  - ◆ inspiratory flow rate/time
  - ◆ pressure support

### Purposes For Monitoring Mechanics

- ▲ Assess condition of lungs
  - ◆ consolidation
  - ◆ surfactant deficiency
  - ◆ bronchospasm

### Purposes For Monitoring Mechanics

- ▲ Evaluate therapeutic effects
  - ◆ bronchodilators
  - ◆ recruitment maneuvers
  - ◆ surfactant
  - ◆ weaning modes
- ▲ Determine when to wean or discontinue support

### Parameters Monitored

- ^ Dynamic/static compliance
- ^ Inspiratory/expiratory resistance to flow
- ^ Total PEEP
- ^ Work of breathing

### Monitoring Methods

- ^ Simple calculation
  - ◆  $PEEP_{total} = (PEEP + PEEP_{intrinsic})$
  - ◆ dynamic compliance = tidal volume / (PIP - PEEP)
  - ◆ static compliance = tidal volume / (P<sub>pt</sub> - PEEP)
  - ◆ resistance = (PIP - P<sub>pt</sub>) / flow

### Measuring Compliance

- ^ Stabilize patient- active expiration will confound results by increasing intrinsic PEEP
- ^ Measure:
  - ◆ exhaled TV
  - ◆ PIP
  - ◆ PEEP (total)
  - ◆ P<sub>pt</sub> (plateau pressure)

### Calculate Compliance

- ^  $C_{dyn} = TVE / (PIP - PEEP)$ 
  - ◆ Example: PIP = 30; PEEP = 5;  
TVE = 0.8L  
 $f C_{dyn} = 0.8L / (30 - 5) = .032 \text{ L/cm H}_2\text{O}$
- ^  $C_{st} = TVE / (P_{pt} - PEEP)$ 
  - ◆ Example: P<sub>pt</sub> = 25; PEEP = 5;  
TVE = 0.8L  
 $f C_{st} = 0.8L / (25 - 5) = .04L/cm H_2O$

### Abnormal C<sub>st</sub>

- ^ Decreased C<sub>st</sub>
  - ◆ ARDS, ALI
  - ◆ Extrathoracic restriction
    - f obesity
    - f ascites, distension
  - ◆ Thoracic restriction
  - ◆ Volume-occupying lesions; e.g., pleural effusion

### Implications- Decreased C<sub>st</sub>

- ^ Increased work of breathing (WOB)
- ^ Ventilation/perfusion inequality (intrapulmonary shunt)
- ^ Increased ventilation pressure requirement s==>
  - ◆ Excessive shear forces on lung tissue, causing inflammation
  - ◆ Hyperinflation of compliant lung units, causing volutrauma

## PEEP Therapy

### Benefits of PEEP in ARDS

- △ Prevents alveolar collapse (AKA de-recruitment)
- △ Re-recruits collapsed alveoli
- △ Reduces shear forces required to ventilate collapsed alveoli

Links to benefits of PEEP

[http://www.chestjournal.org/cgi/reprint/128/5\\_suppl\\_2/592S](http://www.chestjournal.org/cgi/reprint/128/5_suppl_2/592S)

### Adverse Effects of PEEP

- △ increased PVR
- △ increased  $VD_A$
- △ decreased venous return
- △ increased WOB
- △ hyperinflation- volutrauma
- △ right-to-left shunt with patent foramen ovale (PFO)

<http://ccforum.com/content/8/5/R306>

<http://ccforum.com/content/cc3877>

### Optimal PEEP

- △ Defined- level of PEEP that imposes favorable volume-pressure relationship on the majority of lung units ==>
  - ◆ increased Cst
  - ◆ improved gas exchange
  - ◆ reduced shear forces

### Optimal PEEP

- △ Methods for determination
  - ◆ lower inflection point of PV curve
  - ◆ stepwise incremental Cst measurement
  - ◆ stepwise decremental Cst measurement

Links to articles on optimal PEEP

<http://ajrccm.atsjournals.org/cgi/reprint/165/8/1182>

<http://ajrccm.atsjournals.org/cgi/content/abstract/164/5/795>

### Optimal PEEP

- △ Methods for determination
  - ◆ locate lower inflection point (LIP) of PV curve
  - ◆ Optimal PEEP = LIP + 2-3 cm H<sub>2</sub>O

### Stepwise Decremental Technique

- ^ Adjust TV to desired level (<8 ml/kg IBW)
- ^ Adjust FIO<sub>2</sub> to 1.0
- ^ Increase PEEP by 5, up to 20 cm H<sub>2</sub>O
  - ◆ monitor vital signs
  - ◆ monitor SpO<sub>2</sub>
- ^ Adjust FIO<sub>2</sub> for SpO<sub>2</sub> 90-95%

### Stepwise Decremental Technique

- ^ Decrease PEEP by 2 cm H<sub>2</sub>O
  - ◆ Q3 min, or until stabilized
  - ◆ monitor SpO<sub>2</sub>, SvO<sub>2</sub>, vital signs
  - ◆ measure Cst
- ^ Optimal PEEP = level with greatest Cst
- ^ Monitored/adjusted each shift

## Ventilator Wave Form Analysis

### Applications For Graphics

- ^ Assess lung mechanics
  - ◆ resistance
  - ◆ compliance
  - ◆ WOB

### Applications For Graphics

- ^ Assess lung mechanics
  - ◆ resistance
  - ◆ compliance
  - ◆ WOB
- ^ Detect ventilation problems
  - ◆ auto-peep
  - ◆ lung overdistension
  - ◆ patient/ventilator asynchrony

### Applications For Graphics

- ^ Evaluate interventions
  - ◆ bronchodilator therapy

### Applications For Graphics

#### ^ Evaluate interventions

##### ◆ ventilator settings

*f* primary mode

*f* tidal volume, drive pressure

*f* PEEP

*f* ventilation times

*f* trigger level

*f* rise time

*f* expiratory flow limit (PSV)

### Graphic Types

#### ^ waves

◆ pressure-time

◆ flow-time

◆ volume-time

**Clinical Applications For Graphics**

**Clinical Applications For Graphics**

^ Compliance- pressure volume curve

**Clinical Applications For Graphics**

^ Assessment of compliance

**Clinical Applications For Graphics**

^ Detecting auto-peep

◆ zero end-expiratory flow (EEF) ==> zero auto-peep

**Clinical Applications For Graphics**

^ Detecting auto-peep during expiratory hold

- ◆ accurately measured during absence of patient effort
- ◆ active exhalation produces auto-peep

**Clinical Applications For Graphics**

^ Detecting lung overdistension- excess TV

**Clinical Applications For Graphics**

^ Detecting patient/ventilator asynchrony

Courtesy Newport Medical

**Clinical Applications For Graphics**

^ Detecting patient/ventilator asynchrony

Scoping on the upswing of the flow waveform

Significant pressure drop at the onset of patient effort

Courtesy Newport Medical

### Clinical Applications For Graphics

#### ▲ Evaluating inspiratory flow/rise- pressure wave

Linear or bowed upward rise in pressure after trigger on the pressure wave

Slow rise in pressure, concave shape of the pressure wave

Courtesy Newport Medical

### Clinical Applications For Graphics

#### ▲ Evaluating expiratory flow-cycling (PSV)

Patient expiratory effort

Late termination

Inability to trigger

Courtesy Newport Medical

### Clinical Applications For Graphics

#### ▲ Evaluating bronchodilator effectiveness

Courtesy Newport Medical

## End-Tidal CO<sub>2</sub> Monitoring

### Applications

- ▲ Estimate PaCO<sub>2</sub>- reliability not established
- ▲ Monitor changes in PaCO<sub>2</sub>- reliability not established
- ▲ Estimate dead space- reliable for finding V<sub>d</sub>/V<sub>t</sub>

### Applications

- ▲ Confirm ETT placement- reliable
- ▲ Evaluate chest compressions- reliable
- ▲ Detect pulmonary embolism- promising
- ▲ Detect leak in ventilation circuit
- ▲ Compare condition of lungs during independent lung ventilation
- ▲ Predict weaning failure

### Interpretation- PetCO<sub>2</sub>

- ▲ Normal difference between PaCO<sub>2</sub>- PetCO<sub>2</sub> = 2-5 torr
- ▲ Increased P(a-A)CO<sub>2</sub> ==> dead space;  
e.g.:
  - ◆ pulmonary embolus
  - ◆ excessive PEEP

### Interpretation- PetCO<sub>2</sub>

- ▲ Decreased PetCO<sub>2</sub>- ominous sign during resuscitation
  - ◆ low perfusion
  - ◆ embolization
  - ◆ ventilation air leak
- ▲ Increased PetCO<sub>2</sub>
  - ◆ hypoventilation
  - ◆ administration of NaHCO<sub>3</sub>

[http://www.aacn.org/pdfLibra.NSF/Files/Frakes/\\$file/Frakes.pages.pdf](http://www.aacn.org/pdfLibra.NSF/Files/Frakes/$file/Frakes.pages.pdf)

### Interpretation- Normal Capnogram

- A-B: dead space.
- B-C: mixed dead space and alveolar
- C-D: alveolar gas
- D: End-tidal value— Peak CO<sub>2</sub>
- D-E: Inhalation

Link to capnography case studies

### Interpretation- Abnormal Capnogram

- ◆ Airway disconnection
- ◆ Dislodged ET tube/esophageal intubation
- ◆ Totally obstructed/kinked ET tube
- ◆ Complete ventilator malfunction

### Interpretation- Abnormal Capnogram

- ◆ Hyperventilation
- ◆ Hypothermia
- ◆ Sedation, anesthesia
- ◆ Dead space ventilation

### Interpretation- Abnormal Capnogram

- ◆ Incomplete exhalation
- ◆ Partially kinked ET tube
- ◆ Bronchospasm
- ◆ Mucous plugging
- ◆ Poor sampling techniques

### Interpretation - Abnormal Capnogram

- ◆ Cardiopulmonary arrest
- ◆ Pulmonary embolism
- ◆ Sudden hypotension; massive blood loss
- ◆ Cardiopulmonary bypass

### Summary and Review

- ^ Pulmonary mechanics
  - ◆ purposes for measurement
  - ◆ implications
  - ◆ measurement
- ^ Optimal PEEP
  - ◆ implications
  - ◆ measurement

### Summary and Review

- ^ Ventilator waveforms
  - ◆ types
  - ◆ normal waveforms
  - ◆ abnormal waveforms
- ^ ETCO<sub>2</sub> monitoring
  - ◆ applications
  - ◆ interpretation of P(a-et)CO<sub>2</sub>
  - ◆ etCO<sub>2</sub> waveforms
